

POWER AUDITS

Viking Industrial offers a comprehensive Power Audit Service for customers that have existing power fleets. Viking engineers can visit your site and install mapping equipment on your in-situ generators to gain insights into the load behaviour you are experiencing.

Viking then uses that information to present a detailed report highlighting opportunities for improvement in terms of sizing, engine selection, OH+S and bulk fuel requirements.

Viking technicians have completed Power Audits in all Australian States and Territories, uncovering millions of dollars of savings in Mining, Construction, Industrial, Government and Rental Organisations.
